KELPSTAR BORO

Kelpstar Boron is an extract natural concentrate of Ecklonia brown seaweed maxima enriched with boron, specially designed to encourage flowering e the fruit set

Ecklonia maxima is subjected to a particular mechanical cold extraction process that it does not use neither heat nor chemicals, so as to obtain a concentrated liquid extract with an unaltered natural phytohormone content.

The foliar application of **Kelpstar Boron** in pre-flowering improves fruit set and final production both in quantitative and qualitative terms.

IN THE FLOWER

- Promotes the formation of pollen
- Improve fertilization
- Attenuates the phenomena of dripping

IN FRUIT

- Increase the fruit set

Boron is the element most involved in the processes that determine the success of the fruit set; in particular, it increases the antogenic induction, stimulates the germination of the pollen tube and increases the receptivity of the stigma.

The use of Kelpstar Boro is authorized in agriculture biological.
